

sensing[●]the[↑]forest

Dendrophone **Peter Batchelor**

Sound installation
August 2024 - August 2025

This sound installation transforms live environmental data from the forest into a continuously changing soundscape.

You're hearing three layers of sound:

- **A slow breathing rhythm** (tracking CO₂ levels)
- **A shifting drone** (tracking photosynthetic activity)
- **Textured 'dry' or 'wet' sounds** (tracking forest humidity)

These sounds don't replace the natural soundscape around you—they blend with it.

Sometimes it may be hard to tell where the installation ends and the forest begins.

Take a moment to listen.

- **How do these sounds mix with birdsong, wind, or passing people?**
- **Can you hear the drone beneath the distant hum of planes?**
- **What does the forest feel like, when heard through data?**

Scan the QR code to learn how it works—and why it matters.
